

Set up Guide

TheDeliberator® Virtual Keypad

This keypad is designed to demonstrate the functionality of the Deliberator API

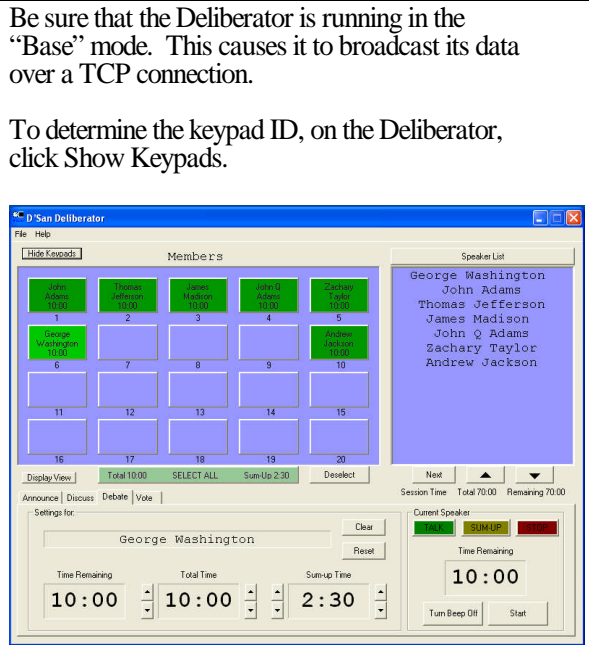

I. Make connection with the base computer

The Keypad communicates with the computer running The Deliberator over a network. Click the wrench icon to open the Setup dialogue box. Input the keypad ID, the port number that matches the TCP port set in the Deliberator and the name of the computer running the Deliberator software (or its IP address)

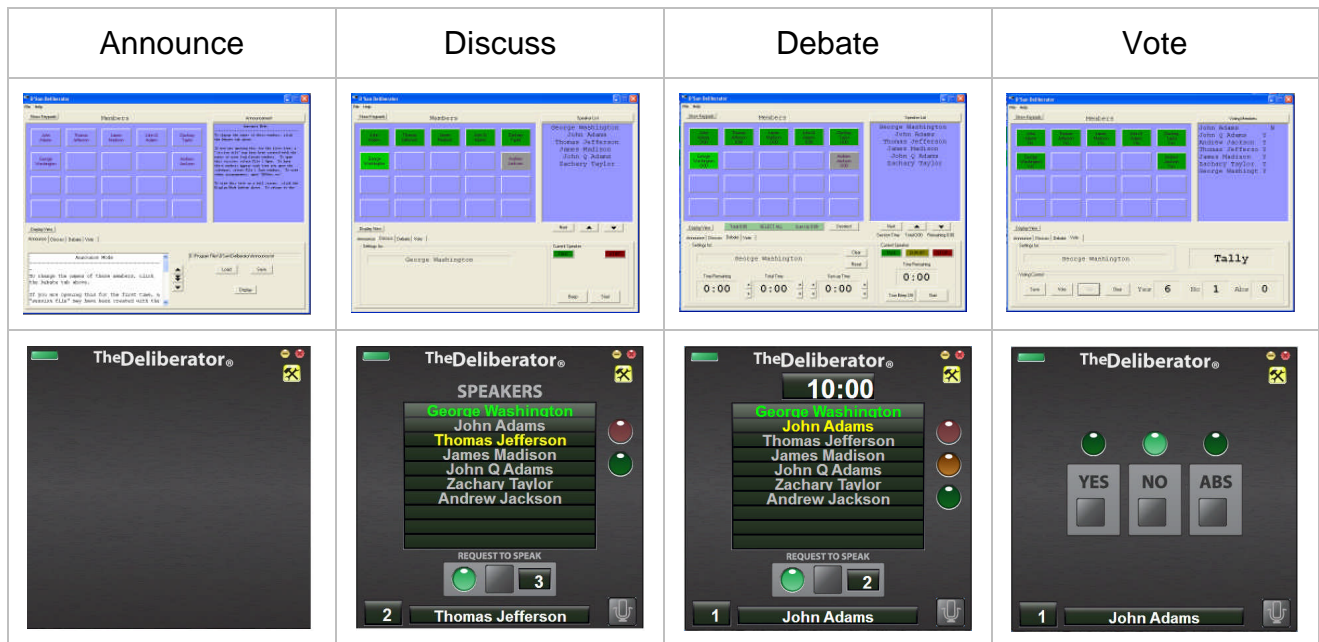

Be sure that the Deliberator is running in the “Base” mode. This causes it to broadcast its data over a TCP connection.

To determine the keypad ID, on the Deliberator, click Show Keypads.

There are four modes in The Deliberator. Different controls will appear on the Keypads when The Deliberator is placed in a different mode.

As soon as the keypad is exchanging data with the Deliberator “server”, the controls relevant to the present Mode appear. (The Announce Mode is NOT supported by the keypad.)

Discuss, Debate, Vote Modes: Name of member can be displayed on keypad
MEMNAMESTR=John Adams ; KEYIDSTR=1; SPEAKSTR2=John Adams
